In the right column, the first part of step 13 should be modified and rearranged to read:

## 13. Design Welds

i) Beam Flanges to End-Plate Weld

Note: For wind and low-seismic applications, it is recommended that the weld design force,  $R_u$ , be taken equal to the calculated flange force but not less than  $\phi(0.6)F_vA_{fb}$ .

This recommended minimum weld design force is based upon engineering judgment and intended to preclude small weld sizes on comparatively larger beams sized for stiffness, and to account for the variations in the distribution of the flange force across the weld length.

Minimum Fillet Weld size 5/16 in.

$$\phi(0.6) F_y A_{fb} = 0.9(0.6)(50 \text{ ksi})(8.22 \text{ in.} \times 0.522 \text{ in})$$

$$R_u = F_{fu} > \phi(0.6) F_y A_{fb}$$
  
$$R_u = 197 \text{ kips} > 116 \text{ kips}$$
  
Use  $R_u = 197 \text{ kips}.$ 

The remainder of step 13 beginning with "Effective length of weld..." is unchanged.
